### DETAILED ACTION

1. This office action is in response to communication filed 2/19/03 (paper #6). Claims 1-4 and 13 are pending.

2. *Claim Rejections - 35 USC § 103*

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-4 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kondo (6,396,954) in view of Young et al (6,064,959).

As per claims 1, 2 and 13, Kondo teaches a sensor data process method for processing data obtained from a sensor, comprising the steps of:

“storing data groups in a database in which a word is attached to each of said data group, said data groups being obtained by classifying inputs from said sensor directly of after processing” (figure 6, his integrated parameter construction 26);

“Classifying an input from said sensor using said database to output a classification result”(figure 6, his classification data construction unit 24).

Art Unit: 2644

It is noted that Kondo teaches the claimed invention but does not explicitly teach: "Temporarily storing input data from said sensor as data of a new data group after classifying said input data when it is determined that said input data does not belong to any of said groups classified in said database"; and "attaching a word to said data of said new group temporarily stored to store said data of new group in said database". However, this feature is well known in the art as evidenced by Young et al who teach at col. 20 lines 13-41, when the system does not recognize a word, it activates the word from a backup dictionary by adding the word to the active dictionary. Therefore, one of ordinary skill in the art at the time the invention was made would have found it obvious to incorporate into Kondo a backup dictionary for activating the word as taught by Young et al because it provides a more versatile system capable of adding new word to the active dictionary.

As per claims 3 and 4, Kondo et al teach status judging means for judging a status using a certain word attached to a group (figure 6, his adaptivity determination unit 27).
